*Specific Testing Parameters

Hollow block: 1,500 psi
Concrete: 3,320 psi

NOTE: All pullout values are based in close-tolerance holes drilled with carbide tipped drill bits.

Designated holding power depends on the quality of the masonry material, depth of the embedment, and proper hole size.

These figures are offered only as a guide and are not guaranteed in any way by Danish Import, Inc. A safety factor of 4:1, or 25% of ultimate pullout value, is generally accepted as a safe working load; however, reference should always be made to applicable codes for the specific safe working ratio.

Jor-set Concrete Screw - Screw Length:

The length of the Jor-set fastener to be used is determined by combining the thickness of the material to be attached with the desired depth of embedment in the base material. It is recommended that a minimum of 1" and a maximum of 1-3/4" embedment be used in determining fastener length. The diameter of the fastener and the depth of embedment affect pullout strengths. The correct hole must be drilled for the screw to obtain the holding values. In all cases the hole must be at least 1/4" deeper than the depth of the fastener embedment.

Jor-Set Concrete Screws feature the Ruspert II Metal Finish

Ruspert® metal finish is a high-grade metal surface processing technology that prevents corrosion. It consists of three layers: the 1st layer; a metallic zinc layer, the 2nd layer; a high-grade anti-corrosion chemical conversion film, and a 3rd outer layer; baked ceramic surface coating. The distinguishing feature of Ruspert® is the tight joining of the baked ceramic surface coating and the chemical conversion film. These layers are bonded together through chemical reactions, and this unique method of combining layers results in a rigid combination of the coating films. Ruspert® treatment does not attribute its anti-corrosion properties to merely a single material, but the synergy of these three layers, which combined have superb rustproof qualities.

Ruspert® features

- Superior corrosion resistance
Excellent resistance against gas, weathering and other kinds of corrosive factors including salt water
- Corrosion resistance against scratches
Composite layers minimize the effect of scratches on the protection coating
- Electrolytic corrosion resistance
Less contact corrosion with other metals
- Low processing temperature
The drying temperature below 200°C protects the products from metallographic changes

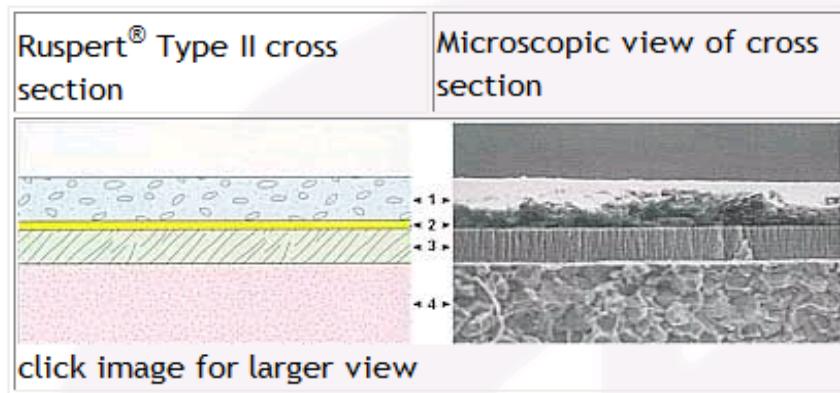

Processing steps

- Metallic zinc treatment
- Chemical treatment
- Ruspert® Coating
- Baking

Types of processing

Type	Performance	Color
Ruspert® Type I	S.S.T. 500 hours DIN 50018 (0.2l) 15 cycles	Silver
Ruspert® Type II	S.S.T. 1000 hours DIN 50018 (0.2l) 15 cycles	Silver, Grey, Black, other colors
Ruspert® Type III	S.S.T. 1000 hours DIN 50018 (2.0l) 15 cycles	Grey
Ruspert® over hot dip galvanizing	S.S.T. 1000 hours DIN 50018 (0.2l) 15 cycles	Silver, Grey, Black, other colors

Coating & rustproofing structure

1. Baked ceramic surface coating layer ($10\mu\text{m}$)
2. Chemical conversion coating layer
3. Metallic zinc layer
4. Steel substrate

* Chemical conversion coating layer + Metallic zinc layer = $5\mu\text{m}$

- 3rd layer - Baked ceramic surface coating layer
Corrosive elements are intercepted by the strong paint film made of ceramic materials
- 2nd layer - Chemical conversion coating layer
Rustproof performance is improved as the chemical conversion inactivates the zinc plated surface and creates a tight adhesion between the chemically converted layer and the paint-layer
- 1st layer - Metallic zinc layer
The steel/iron substrate is protected from corrosion by the self-sacrificial galvanic effect of the zinc coating

Performance testing

Test item	Test result	Test method
Hardness of paint film	Over 4H	Pencil hardness (peeling test)
Adhesion	Nothing abnormal	Peeling test by adhesive tape on cross scribed test piece (1mm width)
Acid resistance	Nothing abnormal	Immersion in 5% sulfuric acid solution for 24 hours
Alkali resistance	Nothing abnormal	Immersion in 5% sodium hydroxide solution for 72 hours
Heat resistance	Nothing abnormal	Exposure to 250°C heat for 1 hour
Accelerated weathering	Free from red rust	In sunshine weather-o-meter for 1000 hours
Contact corrosion with other metals	Clearly superior to galvanization (colored chromating) and hot dip galvanizing	Corrosive investigation after Salt Spray Test (JIS Z2371) done comparatively on surface-treated steel bolts/nuts tightened on a stainless steel plate
